Are You Sure AI-Generated Code Is Correct?

AI can generate code in seconds. But thousands of AI-generated test cases cannot guarantee its correctness.

Write Rust and Prove It Directly in Lean 4.

Rust code

kernel/src/lib.rs

```rust
fn delete(user: u64, s: &Snapshot, id: u64) -> Outcome {
    match find_post(&s.posts, id) {
        None => Err(Error::NotFound),
        Some(p) => if p.author == user
            || is_moderator(&s.moderators, user) {
            Ok((one(Write::DelPost(id)), Reply::Done))
        } else { Err(Error::Forbidden) },
    }
}
```

→

Lean 4 proof

proofs/Theorems.lean

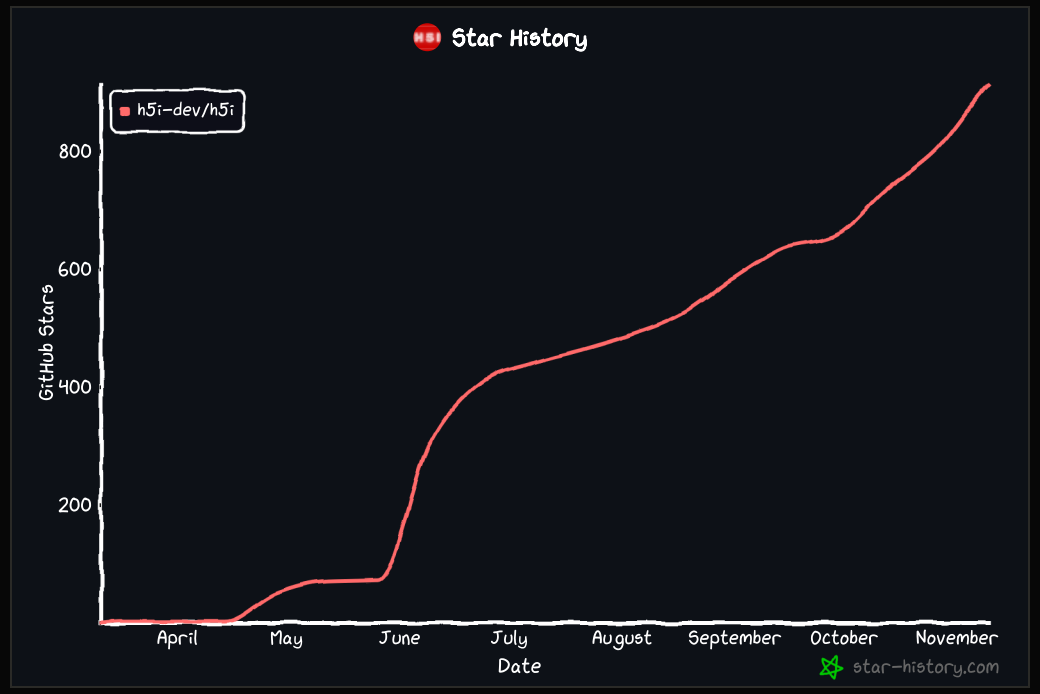

```
theorem authorized (a : Principal) (s : Snapshot)
    (c : Command) ws r (hinv : Inv (Snapshot.toSt s))
    (h : transition a s c = .ok (.Ok (ws, r))) :
    ∀ w ∈ ws.val,
      allowed (Snapshot.toSt s) a.user.val w := by
  -- proof body omitted
```

→

Guarantee

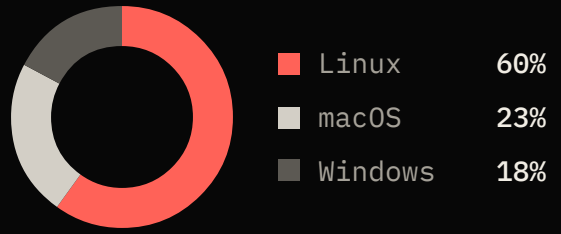

Only the author or a moderator can delete.
